

Missouri Department of Health and Senior Services

Bureau of HIV, STD, and Hepatitis

HIV/STD Statistics

June 2008

Notes to the Reader:

- **HIV disease** represents all individuals diagnosed with the human immunodeficiency virus (HIV), regardless of the stage of disease progression. All persons with HIV disease can be sub-classified as either an **AIDS case** (if they are in the later stages of the disease process and have met the case definition for AIDS), or an **HIV case** (if they are in the earlier stages of the disease process and have not met the AIDS case definition). In this report, the sub-classification of HIV or AIDS is based on an individual's status of disease progression as of June 30, 2008.
- The data presented in this report only includes cases **diagnosed** through June 30, 2008, based on information **reported** to the Missouri Department of Health and Senior Services through September 2008. The difference between the date of diagnosis and the date of report represents delays in case reporting.
- When assessing trends over time, please note that data presented for 2008 only represent cases diagnosed through June 30, 2008. All data are subject to change.
- Additional data quality assurances undertaken in the past year have improved data quality, but have resulted in changes in the number of reported cases over time. This may result in discrepancies when comparing the current report to previous epidemiological data.

Figure 1. HIV disease cases, by current status* and year of diagnosis**, Missouri, 1998—2008[†]

*HIV case vs. AIDS case

**Cases are indicated by year of initial diagnosis reported to the Missouri Department of Health and Senior Services. (The year in which the first diagnosis of the person, whether as an HIV case or an AIDS case, was documented by the Department).

[†]Only includes cases diagnosed through June 30, 2008 and reported by September 30, 2008.

***These cases were either: 1) initially reported as HIV cases and then later reclassified as AIDS cases because they subsequently met the AIDS case definition; or 2) initially reported as AIDS cases.

****These cases were initially reported as HIV cases and have remained HIV cases. They have not met the case definition for AIDS as of June 30, 2008.

- Since 1982, there have been a total of 16,596 HIV disease cases diagnosed through June 30, 2008.
- Between 1998 and 2007, the number of new HIV disease diagnoses has ranged from 514 cases in 2000, to 619 cases in 2005. Overall, the number of new cases has remained relatively stable from 1998 to 2007.
- There have been 282 new HIV disease diagnoses from January to June 2008. The majority of these individuals were classified as HIV cases, not AIDS as of June 30, 2008.
- The differences in the number of individuals sub-classified as AIDS cases are due to the progression of the disease over time. For those diagnosed with HIV disease in 1998, a larger number are currently classified as AIDS cases compared to those diagnosed in 2007 because they have been living with the virus longer.

HIV/STD Statistics

June 2008

Figure 2. HIV disease deaths*, by selected race, by year of death, Missouri, 1998—2008†

*Includes deaths that have occurred among those diagnosed with HIV disease in Missouri.

†Only includes deaths through June 30, 2008, and reported by September 30, 2008.

Figure 3. Persons diagnosed with HIV disease by current vital status* and year of diagnosis**, Missouri, 1998—2008†

*Vital status on June 30, 2008.

**Cases are indicated by year of initial diagnosis reported to the Missouri Department of Health and Senior Services. (The year in which the first diagnosis of the person, whether as an HIV case or an AIDS case, was documented by the Department).

†Only includes events occurring through June 30, 2008 and reported by September 30, 2008.

- The total number of deaths among those diagnosed with HIV disease in Missouri decreased from 1998 to 2007 (Figure 2), likely due to the introduction of highly actively antiretroviral therapy (HAART) in 1996.
- A larger number of those diagnosed in 1998 have died as of June 30, 2008 compared to those diagnosed in 2007, likely due to differences in the length of time living with the virus and current age (Figure 3).

*Includes all individuals diagnosed with the HIV virus, regardless of current status (i.e., HIV or AIDS).

**Per 100,000 population based on 2007 MDHSS estimates.

[†]Only includes cases diagnosed or living as of June 30, 2008 and reported by September 30, 2008.

***Based on age as of June 30, 2008. Current age is missing for 37 living cases.

- There are 10,613 individuals living with HIV disease that were diagnosed in Missouri through June 30, 2008.
- A greater proportion of the newly diagnosed cases occurred among blacks compared to living cases.
- The majority of newly diagnosed cases are between the ages of 25-44 years old (55.0%). The majority of living cases are currently between the ages of 25-44 (47.4%) and 45-64 (45.1%).

Table 2. New and living HIV disease cases by exposure category, Missouri 2008[†]

Exposure category	HIV Disease			
	2008 [†]	Living*		
Adult/Adolescent				
Men who have sex with men	136	48.6%	7,019	66.7%
Men who have sex with men and inject drugs	11	3.9%	688	6.5%
Injecting drug use	7	2.5%	847	8.0%
Heterosexual contact	10	3.6%	1,891	18.0%
Hemophilia/coagulation disorder	0	0.0%	65	0.6%
Blood transfusion or tissue recipient	0	0.0%	14	0.1%
No indicated risk (NIR)	116	41.4%	-----	-----
ADULT/ADOLESCENT SUBTOTAL	280	100.0%	10,527 **	100.0%
Pediatric (<13 years old)				
PEDIATRIC SUBTOTAL	2	100.0%	86	100.0%
TOTAL	282		10,613	

*Cases with no identified risk were proportionately re-distributed to known exposure categories.

[†]Only includes cases diagnosed through June 30, 2008 and reported by September 30, 2008.

**Includes 3 cases with a confirmed "other" exposure category.

Figure 4. Living HIV disease cases by adjusted* exposure category and race/ethnicity, Missouri, 2008[†]

*Cases with no identified risk were proportionately re-distributed to known exposure categories. Percentages may not total 100 due to rounding.

[†]Only includes cases diagnosed and living as of June 30, 2008 and reported by September 30, 2008.

- Of cases diagnosed from January to June 2008, 41.4% did not have a reported risk as of September 30, 2008. Surveillance activities have been implemented to resolve cases reported with unknown risk information. These cases will not be proportionately re-distributed until the end of the surveillance follow-up period (Table 2).
- The majority of living cases are attributed to men who have sex with men (66.7%), followed by heterosexual contact (18.0%). Cases with missing exposure category information have been proportionately re-distributed into known exposure categories (Table 2).
- There are differences in the distribution of exposure categories among living cases by race/ethnicity (Figure 4). Among whites, 73% of living cases are attributed to men who have sex with men, compared to 58% among blacks. In contrast, heterosexual contact represents the exposure category for 27% of living black cases, but only 11% of living white cases.

Figure 5. Number of persons living with HIV disease by county of residence* and HIV region at time of diagnosis, Missouri, 1982-2008[†]

*Based on residence at time of most recent diagnosis of HIV or AIDS. Excludes persons diagnosed in Missouri correctional facilities and 14 cases missing county of residence at time of diagnosis.

[†]Includes those living with HIV disease as of June 30, 2008 and reported by September 30, 2008.

Figure 6. Persons diagnosed with HIV disease by HIV region at time of diagnosis, Missouri, 1998-2008[†]

[†]Only includes cases diagnosed through June 30, 2008 and reported by September 30, 2008.

- Figure 5 presents the number of cases still presumed to be living whose most recent diagnosis (i.e. HIV or AIDS) occurred in the county. It does not reflect the current number of cases living in the county. The majority of living cases were diagnosed in Jackson county, St. Louis city and St. Louis county.
- The number of cases diagnosed in each geographic region has remained relatively stable from 1998 to 2007. In the Kansas City region the number of new diagnoses increased from 2003 to 2007, after decreasing from 1998 to 2003 (Figure 6).

*Includes cases identified with Hispanic ethnicity.

Figure 7. Reported P&S syphilis cases by county, Missouri, 2008[†]

Figure 8. Reported P&S syphilis cases by geographic area and year of report, Missouri, 2003-2008[†]

[†]Only includes cases reported through June 30, 2008.

- There have been a total of 124 P&S syphilis cases reported through June 30, 2008 in Missouri (Table 3).
- From 2003 to 2007 there has been an increase in the number of reported P&S syphilis cases in Missouri overall. Trends for 2008 cannot be assessed at this time (Figure 8).
- Of the P&S syphilis cases reported from January 1 to June 30, 2008, 38 (30.6%) were co-infected with HIV. All co-infections were diagnosed among males. Thirty-five of the co-infections were attributed to men who have sex with men, 1 was attributed to heterosexual contact, and 2 co-infections had no identified risk.

EARLY LATENT SYPHILIS

[†]Includes cases reported through June 30, 2008.

Figure 10. Reported early latent syphilis cases by geographic area and year of report, Missouri, 2003-2008[†]

[†]Only includes cases reported through June 30, 2008.

- A total of 79 early latent syphilis cases have been reported in Missouri through June 30, 2008 (Table 4).
- Overall from 2003 to 2007 there has been an increase in the number of reported early latent syphilis cases in Missouri, with slight decrease in 2006. Trends for 2008 cannot be assessed at this time (Figure 10).
- Of the early latent syphilis cases reported from January 1 to June 30, 2008, 27 (34.2%) were co-infected with HIV. Males represented 26 of the 27 co-infections diagnosed. Twenty-three of the co-infections were attributed to men who have sex with men, 2 were attributed to men who have sex with men and injection drug use, 1 was attributed to heterosexual contact, and 1 had no identified risk.

GONORRHEA
